Section 4.4 Exercises 24, 25, 30, 33, 34, 38

Section 7.1 Exercises 9, 10, 12, 16, 18, 19.

Section 4.4 24. Suppose $f: \mathbb{R}^3 \rightarrow \mathbb{R}$ is a C^2 scalar function. Which of the following expressions are meaningful, and what are nonsense? For those which are meaningful, decide whether the expression defines a scalar function or a vector field.

- (a) $\text{curl}(\text{grad } f) \rightarrow$ meaningful, the curl of a vector field results in a vector field.
- (b) $\text{grad}(\text{curl } f) \rightarrow$ nonsense
- (c) $\text{div}(\text{grad } f) \rightarrow$ meaningful, the divergence of a vector field is a scalar function.
- (d) $\text{grad}(\text{div } f) \rightarrow$ meaningful, the gradients of a scalar function is a vector field.
- (e) $\text{curl}(\text{div } f) \rightarrow$ nonsense
- (f) $\text{div}(\text{curl } f) \rightarrow$ meaningful, the divergence of a vector field is a scalar function.

25. Suppose $F: \mathbb{R}^3 \rightarrow \mathbb{R}^3$ is a C^2 vector field. Which of the following expressions are meaningful, and which are nonsense? For those which are meaningful, decide whether the expression defines a scalar function or a vector field.

- (a) $\text{curl}(\text{grad } F) \rightarrow$ Nonsense
- (b) $\text{grad}(\text{curl } F) \rightarrow$ Nonsense
- (c) $\text{div}(\text{grad } F) \rightarrow$ Nonsense
- (d) $\text{grad}(\text{div } F) \rightarrow$ meaningful, vector field.
- (e) $\text{curl}(\text{div } F) \rightarrow$ Nonsense
- (f) $\text{dir}(\text{curl } F) \rightarrow$ meaningful, scalar function

EXERCISE

30. f(x, y, z) = xy + yz + zx

Verify that $\nabla \times (\nabla f) = 0$ for the functions

$$\nabla f = \left(\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial f}{\partial z} \right)$$

$$\nabla \times \nabla f = \begin{vmatrix} i & j & k \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ \frac{\partial f}{\partial x} & \frac{\partial f}{\partial y} & \frac{\partial f}{\partial z} \end{vmatrix} = \left(\frac{\partial^2 f}{\partial y \partial z} - \frac{\partial^2 f}{\partial z \partial y} \right) i + \left(\frac{\partial^2 f}{\partial x \partial z} - \frac{\partial^2 f}{\partial z \partial x} \right) j + \left(\frac{\partial^2 f}{\partial x \partial y} - \frac{\partial^2 f}{\partial y \partial x} \right) k$$

$$\nabla f = \left(\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial f}{\partial z} \right) = (y+z, x+z, y+x)$$

$$\nabla \times \nabla f = \begin{vmatrix} i & j & k \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y+z & x+z & y+x \end{vmatrix} = \left(\frac{\partial}{\partial y}(y+x) - \frac{\partial}{\partial z}(x+z) \right) i - \left(\frac{\partial}{\partial x}(y+x) - \frac{\partial}{\partial z}(y+z) \right) j + \left(\frac{\partial}{\partial x}(x+z) - \frac{\partial}{\partial y}(y+z) \right) k = (1-1)i - (1-1)j + (1-1)k = 0$$

Thus, $\nabla \times (\nabla f) = 0$.

33. Show that $F = y(\cos x)i + x(\sin y)j$ is not a gradient vector field.

If F were a gradient field, then it would satisfy $\operatorname{curl} F = 0$.

$$\begin{aligned} \operatorname{curl} F &= \begin{vmatrix} i & j & k \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y(\cos x) & x(\sin y) & 0 \end{vmatrix} \\ &= \left(\frac{\partial}{\partial y}(0) - \frac{\partial}{\partial z}(x(\sin y)) \right) i - \left(\frac{\partial}{\partial x}(0) - \frac{\partial}{\partial z}(y(\cos x)) \right) j + \left(\frac{\partial}{\partial x}(x(\sin y)) - \frac{\partial}{\partial y}(y(\cos x)) \right) k \\ &= (0-0)i - (0-0)j + (\sin y - \cos x)k \\ &= (\sin y - \cos x)k \end{aligned}$$

$\operatorname{curl} F \neq 0$. So F cannot be a gradient vector field.

34. Show that $\mathbf{F} = (x^2 + y^2)\mathbf{i} - 2xy\mathbf{j}$ is not a gradient field.
 If \mathbf{F} were a gradient field, then it would satisfy $\operatorname{curl} \mathbf{F} = 0$.

$$\begin{aligned}\operatorname{curl} \mathbf{F} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x^2 + y^2 & -2xy & 0 \end{vmatrix} \\ &= \left(\frac{\partial}{\partial y}(0) - \frac{\partial}{\partial z}(-2xy) \right) \mathbf{i} - \left(\frac{\partial}{\partial x}(0) - \frac{\partial}{\partial z}(x^2 + y^2) \right) \mathbf{j} + \left(\frac{\partial}{\partial x}(-2xy) - \frac{\partial}{\partial y}(x^2 + y^2) \right) \mathbf{k} \\ &= (0-0) \mathbf{i} - (0-0) \mathbf{j} + ((-2y) - (2y)) \mathbf{k} \\ &= (-4y) \mathbf{k} \neq 0.\end{aligned}$$

So \mathbf{F} cannot be a gradient vector field.

38. Let $\mathbf{r}(x, y, z) = (x, y, z)$ and $r = \sqrt{x^2 + y^2 + z^2} = \|\mathbf{r}\|$. Prove the following identities.

(a) $\nabla(\frac{1}{r}) = -\mathbf{r}/r^3$; and, in general, $\nabla(r^n) = nr^{n-2}\mathbf{r}$ and

$$\nabla(\log r) = \mathbf{r}/r^2?$$

$$\begin{aligned}\nabla\left(\frac{1}{r}\right) &= \left(\frac{\partial}{\partial x}\right)\mathbf{i} + \left(\frac{\partial}{\partial y}\right)\mathbf{j} + \left(\frac{\partial}{\partial z}\right)\mathbf{k} \left(\frac{1}{r}\right) \\ &= \left(-\frac{1}{r^2}\frac{\partial r}{\partial x}\right)\mathbf{i} + \left(-\frac{1}{r^2}\frac{\partial r}{\partial y}\right)\mathbf{j} + \left(-\frac{1}{r^2}\frac{\partial r}{\partial z}\right)\mathbf{k} \\ &= \frac{1}{r^2}\left(\frac{\mathbf{r}}{r}\right) = -\frac{\mathbf{r}}{r^3}\end{aligned}$$

(b) $\nabla^2\left(\frac{1}{r}\right) = 0$, $r \neq 0$; and, in general, $\nabla^2 r^n = n(n+1)r^{n-2}$

$$\nabla\left(\frac{1}{r}\right) = -\frac{\mathbf{r}}{r^3}$$

$$[\text{use } \nabla \cdot (\frac{\mathbf{r}}{r^3}) = \frac{1}{r^3} \nabla \cdot \mathbf{r} + \mathbf{r} \cdot \nabla(\frac{1}{r^3})]$$

$$= \frac{3}{r^3} + \mathbf{r} \cdot \left(-\frac{3\mathbf{r}}{r^5}\right)$$

$$= \frac{3}{r^3} - \frac{3}{r^3} = 0$$

of f along c . $\int_0^1 f(\gamma(t)) dt = \int_0^1 f(\gamma(t)) \gamma'(t) dt$. See (3.1).

(a) Verify the formula $\int_0^1 f(\gamma(t)) dt = \lim_{n \rightarrow \infty} \sum_{i=1}^n f(\gamma(t_i)) \Delta t$ for the value of f along c using Riemann sums.

The path integral $\int_0^1 f(\gamma(t)) dt = \lim_{n \rightarrow \infty} \sum_{i=1}^n f(\gamma(t_i)) \Delta t = \int_0^1 f(\gamma(t)) dt$.

The partition sum has the form $\sum_{i=1}^n f(\gamma(t_i)) \Delta t$.

$$\left[(a + (i-1)\Delta t + (i-1)\Delta t) - \left(\frac{(i-1)\Delta t}{2} + (a + (i-1)\Delta t)(i-1)\Delta t - \right) \right] \Delta t$$

$$[a\Delta t] = [(a + (i-1)\Delta t) - (a + (i-1)\Delta t)] \Delta t =$$

(c) $\nabla \cdot (\frac{1}{r^3} \mathbf{r}) = 0$; and in general, $\nabla \cdot (r^n \mathbf{r}) = (n+3)r^n$.

$$\begin{aligned}\nabla \cdot \left(\frac{1}{r^3} \mathbf{r}\right) &= \frac{1}{r^3} \nabla \cdot \mathbf{r} + \mathbf{r} \cdot \nabla \left(\frac{1}{r^3}\right) \\ &= \frac{3}{r^3} + \mathbf{r} \cdot \left(-\frac{3r}{r^5}\right) \\ &= \frac{3}{r^3} - \frac{3}{r^3} = 0\end{aligned}$$

Please indicate
if it is a vector.

(d) $\nabla \times \mathbf{r} = 0$; and in general, $\nabla \times (r^n \mathbf{r}) = 0$.

$$\begin{aligned}\nabla \times \mathbf{r} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x & y & z \end{vmatrix} = \left(\frac{\partial}{\partial y}(z) - \frac{\partial}{\partial z}(y) \right) \mathbf{i} - \left(\frac{\partial}{\partial x}(z) - \frac{\partial}{\partial z}(x) \right) \mathbf{j} + \left(\frac{\partial}{\partial x}(y) - \frac{\partial}{\partial y}(x) \right) \mathbf{k} \\ &= (0-0) \mathbf{i} - (0-0) \mathbf{j} + (0-0) \mathbf{k} \\ &= 0.\end{aligned}$$

Section 7.1 9. Let $f(x, y, z) = y$ and $c(t) = (0, 0, t)$, $0 \leq t \leq 1$. Prove that $\int_C f ds = 0$.

$$\int_C f ds = \int_a^b f(x(t), y(t), z(t)) \|c'(t)\| dt$$

$$c'(t) = (0, 0, 1)$$

$$\|c'(t)\| = \sqrt{(0)^2 + (0)^2 + (1)^2} = \sqrt{1} = 1$$

$$\int_C f ds = \int_{t=0}^{t=1} 0(1) dt = 0.$$

10. Evaluate the following path integrals $\int_C f(x, y, z) ds$, where

(a) $f(x, y, z) = x + y + z$ and $c: t \mapsto (\sin t, \cos t, t)$, $t \in [0, 2\pi]$

$$\int_C f ds = \int_a^b f(x(t), y(t), z(t)) \|c'(t)\| dt$$

$$c'(t) = (\cos t, -\sin t, 1)$$

$$\|c'(t)\| = \sqrt{\cos^2 t + (-\sin t)^2 + 1^2} = \sqrt{1+1} = \sqrt{2}$$

$$\int_C f ds = \int_0^{2\pi} (\sin t + \cos t + t)(\sqrt{2}) dt$$

$$= \sqrt{2} \left[-\cos t + \sin t + \frac{t^2}{2} \right]_0^{2\pi}$$

$$= \sqrt{2} \left[\left(-\cos(2\pi) + \sin(2\pi) + \frac{(2\pi)^2}{2} \right) - \left(-\cos(0) + \sin(0) + 0 \right) \right]$$

$$= \sqrt{2} \left[(-1 + 0 + 2\pi^2) - (-1 + 0 + 0) \right] = \sqrt{2} (-1 + 2\pi^2 + 1) = \boxed{2\sqrt{2}\pi^2}$$

$$(b) f(x, y, z) = \cos z, c \text{ as in part (a)}$$

$$\int_c f ds = \int_a^b f(x(t), y(t), z(t)) \|c'(t)\| dt$$

$$c'(t) = (\cos t, -\sin t, 1)$$

$$\|c'(t)\| = \sqrt{\cos^2 t + (-\sin^2 t) + 1^2} = \sqrt{2}$$

$$\int_c f ds = \int_0^{2\pi} (\cos t) \sqrt{2} dt = \sqrt{2} \int_0^{2\pi} \cos t dt$$

$$= \sqrt{2} [\sin t]_0^{2\pi} = \sqrt{2} (\sin(2\pi) - \sin(0)) = \boxed{0}$$

12. Evaluate the integral of $f(x, y, z)$ along the path c , where

$$(a) f(x, y, z) = x \cos z, c: t \mapsto t\mathbf{i} + t^2\mathbf{j}, t \in [0, 1].$$

$$\int_c f ds = \int_a^b f(x(t), y(t), z(t)) \|c'(t)\| dt$$

$$c'(t) = (1, 2t)$$

$$\|c'(t)\| = \sqrt{1^2 + (2t)^2} = \sqrt{1+4t^2}$$

$$\int_c f ds = \int_0^1 t \cos(0) \sqrt{1+4t^2} dt = \int_0^1 t \sqrt{1+4t^2} dt$$

$$\begin{aligned} & \text{Let } u = 1+4t^2 \quad du = 8t dt \quad t=1 \Rightarrow u=5 \quad t=0 \Rightarrow u=1 \\ & = \frac{1}{8} \int_{u=1}^{u=5} \sqrt{u} du = \frac{1}{8} \int_{u=1}^{u=5} u^{\frac{1}{2}} du = \frac{1}{8} \left[\frac{2}{3} u^{\frac{3}{2}} \right]_{u=1}^{u=5} \\ & = \frac{1}{12} (5^{\frac{3}{2}} - 1^{\frac{3}{2}}) = \boxed{0} \end{aligned}$$

They are concerned with the application of the path integral to the problem of defining the average value of a scalar function along a path. Define the number $\frac{\int_c f(x, y, z) ds}{l(c)}$ to be the average value of f along c . Here $l(c)$ is the length of the path: $(c) = \int_c \|c'(t)\| dt$.

16. (a) Justify the formula $[\int_c f(x, y, z) ds]/l(c)$ for the average value of f along c using Riemann Sums.

The path integral $\lim_{N \rightarrow \infty} S_N = \int_a^b f(x(t), y(t), z(t)) \|c'(t)\| dt = \int_c f(x, y, z) ds$

The partial sum has the form $S_N = \sum_{i=1}^N f(x(t_i^*), y(t_i^*)) (s_i - s_{i-1})$,
where $(s_i - s_{i-1}) = \int_{t_{i-1}}^{t_i} \|c'(t)\| dt$.

Then,

$\sum_{i=1}^N (S_i - S_{i-1}) = L(c)$

and so the quotient

$$\frac{\sum_{i=1}^N f(x(t_i^*), y(t_i^*))(S_i - S_{i-1})}{\sum_{i=1}^N (S_i - S_{i-1})} = \frac{\sum_{i=1}^N f(x(t_i^*), y(t_i^*))(S_i - S_{i-1})}{L(c)}$$

is the approximate average obtained by considering $f(x(t_i^*), y(t_i^*))$ to be constant along each of the arc A_{S_i} . The limit as $N \rightarrow \infty$ of the sequence $\{S_n\}_{n=1}^{\infty}$ is the average value of f along c . So we have the formula $\int_c f(x, y, z) ds / L(c)$.

(b) Show that the average value of f along c in Example 1 is $(1 + \frac{4}{3}\pi^2)$.

$$\frac{\int_c f(x, y, z) ds}{L(c)} \text{ where } L(c) = \int_c \|c'(t)\| dt.$$

$$\begin{aligned} \int_c f(x, y, z) ds &= \frac{2\sqrt{2}\pi}{3}(3 + 4\pi^2). \\ L(c) &= \int_0^{2\pi} \|c'(t)\| dt = \int_0^{2\pi} \sqrt{2} dt \\ &= \sqrt{2} [t]_0^{2\pi} = \sqrt{2}(2\pi - 0) = 2\sqrt{2}\pi. \end{aligned}$$

$$\begin{aligned} \frac{\int_c f(x, y, z) ds}{L(c)} &= \frac{\frac{2\sqrt{2}\pi}{3}(3 + 4\pi^2)}{2\sqrt{2}\pi} = \frac{2\sqrt{2}\pi(3 + 4\pi^2)}{3(2\sqrt{2}\pi)} \\ &= \frac{3 + 4\pi^2}{3} = 1 + \frac{4}{3}\pi^2 \end{aligned}$$

(c) In Exercise 10(a) and (b) above, find the average value of f over the given curves.

$$\text{Ex 10(a)} \quad \frac{\int_c f(x, y, z) ds}{L(c)} = \frac{\frac{2\sqrt{2}\pi^2}{3}}{\int_0^{2\pi} \sqrt{2} dt} = \frac{\frac{2\sqrt{2}\pi^2}{3}}{2\sqrt{2}\pi} = \boxed{\pi}$$

$$\text{Ex 10(b)} \quad \frac{\int_c f(x, y, z) ds}{L(c)} = \frac{0}{\int_0^{2\pi} \sqrt{2} dt} = \frac{0}{2\sqrt{2}\pi} = \boxed{0}$$

18. Suppose the semicircle in Exercise 17 is made of a wire with a uniform density of 2 grams per unit length.

(a) What is the total mass of the wire?

$$\text{Total mass} = \int_C f \, ds \quad \text{uniform density} \Rightarrow f(x, y, z) = 1$$

$$C'(t) = (0, a\cos\theta, -a\sin\theta)$$

$$\|C'(t)\| = \sqrt{0^2 + (a\cos\theta)^2 + (-a\sin\theta)^2} = \sqrt{0 + a^2\cos^2\theta + a^2\sin^2\theta} \\ = \sqrt{a^2(\cos^2\theta + \sin^2\theta)} = \sqrt{a^2} = a$$

$$\text{Total mass} = \int_0^\pi a \, dt$$

$$= a[t]_0^\pi = [a\pi]$$

(b) Where is the center of mass of this configuration of wire?

$$\theta \mapsto (0, a\sin\theta, a\cos\theta).$$

$$x = 0 \quad y = a\sin\theta, \quad z = a\cos\theta.$$

$$\bar{x} = \frac{1}{2} \int_0^\pi 0(a) \, dt = 0$$

$$\bar{y} = \frac{1}{2} \int_0^\pi (a\sin\theta) a \, dt = -\frac{a^2}{2} [\cos\theta]_0^\pi$$

$$= -\frac{a^2}{2} (-1 - 1) = -\frac{a^2}{2} (-2) = a^2$$

$$\bar{z} = \frac{1}{2} \int_0^\pi (a\cos\theta) a \, dt = \frac{a^2}{2} [\sin\theta]_0^\pi$$

$$= \frac{a^2}{2} (0 - 0) = 0$$

The center of mass of this configuration of wire is in $[0, a^2, 0]$

19. Let C be the path given by $C(t) = (t^2, t, 3)$ for $t \in [0, 1]$.

(a) Find $L(C)$, the length of the path

$$L(C) = \int_C \|C'(t)\| \, dt$$

$$C'(t) = (2t, 1, 0)$$

$$\|C'(t)\| = \sqrt{(2t)^2 + (1)^2 + (0)^2} = \sqrt{4t^2 + 1}$$

$$L(C) = \int_0^1 \sqrt{4t^2 + 1} \, dt = \int_0^1 \sqrt{(2t)^2 + 1^2} \, dt$$

$$= \frac{1}{2} \left[t \sqrt{4t^2 + 1} + \log(t + \sqrt{4t^2 + 1}) \right]_0^1$$

$$= \left(\frac{1}{2} \left[\sqrt{5} + \log(1 + \sqrt{5}) \right] - (0 + \log 1) \right) \sqrt{5}$$

(b) Find the average y coordinate along the path C .

$$\frac{\int_0^1 t \sqrt{4t^2+1} dt}{L(C)}$$

$$L(C) = \frac{\sqrt{5}}{2} + \frac{1}{2} \log(1+\sqrt{5})$$

$$\int_0^1 t \sqrt{4t^2+1} dt \quad u = 4t^2+1 \quad du = 8t dt \\ t=1 \Rightarrow u=5 \quad t=0 \Rightarrow u=1$$

$$= \frac{1}{8} \int_{u=1}^{u=5} \sqrt{u} du = \frac{1}{8} \int_{u=1}^{u=5} u^{\frac{1}{2}} du$$

$$= \frac{1}{8} \left(\frac{2}{3} \right) \left[u^{\frac{3}{2}} \right]_{u=1}^{u=5}$$

$$= \frac{1}{12} [5^{\frac{3}{2}} - 1]$$

$$\text{The average } y \text{ coordinate} = \frac{\frac{1}{12}[5^{\frac{3}{2}} - 1]}{\frac{\sqrt{5}}{2} + \frac{1}{2} \log(1+\sqrt{5})}$$

$$= (5) \frac{\frac{1}{12}(25 - 1)}{\frac{\sqrt{5}}{2}} = \frac{\frac{1}{12}(24)}{\frac{\sqrt{5}}{2}} = \frac{24}{\sqrt{5}}$$

$$= 24 \cdot \frac{2}{\sqrt{5}} = \frac{48}{\sqrt{5}} = \frac{48\sqrt{5}}{5}$$

$$= (0-0) \frac{\frac{2}{3} + \frac{4\pi^2}{3}}{\frac{5}{3}} = 1 + \frac{4}{3}\pi^2$$

2) Find the average ρ coordinate over the given interval of t over the given curve, C , in $[0, 5, 0]$ in (x, y, z) coordinates.

$$\rho = (1+t)^{\frac{1}{2}} \quad (x, y, z) = (t, t^2, t^3) \quad \rho = \sqrt{1+t^2} \quad \text{from part 3 to 1, P1}$$

$$(0, 1, \sqrt{5}) = (t)^{\frac{1}{2}}$$

$$1 + t^2 + t^4 = \sqrt{1+t^2} + \sqrt{(1+t^2)t^2} = ||(t)^{\frac{1}{2}}||$$

$$= \sqrt{1 + (1+t^2)t^2} = \sqrt{1 + t^2 + t^4} = ||(t)^{\frac{1}{2}}||$$

$$= \frac{1}{5} \left[\left[(1+t^2)t^2 + t^2 \right]^{\frac{1}{2}} \right] = \frac{1}{5} \left[[(1+t^2)t^2 + t^2]^{1/2} \right] =$$

$$= \frac{1}{5} \left[[(1+t^2)t^2 + t^2]^{1/2} \right] = \frac{1}{5} \left[[(1+t^2)t^2 + t^2]^{1/2} \right] =$$
